Biology

Selected Biologically Important Redox Couples

Redox Couple	E' ₀ (Volts) ^a
Ferredoxin(Fe ³⁺) + e ⁻ \longrightarrow ferredoxin (Fe ²⁺)	-0.42
$NAD(P)^{+} + H^{+} + 2e^{-} \longrightarrow NAD(P)H$	-0.32
$S + 2H^+ + 2e^- \longrightarrow H_2S$	-0.274
Acetaldehyde $+ 2H^+ + 2e^- \longrightarrow$ ethanol	-0.197
$Pyruvate^{-} + 2H^{+} + 2e^{-} \longrightarrow lactate^{2-}$	-0.185
$FAD + 2H^+ + 2e^- \longrightarrow FADH_2$	-0.18^{b}
Oxaloacetate ²⁻ + $2H^+$ + $2e^- \longrightarrow malate^{2-}$	-0.166
$Fumarate^{2-} + 2H^{+} + 2e^{-} \longrightarrow succinate^{2-}$	0.031
Cytochrome b (Fe ³⁺) + e ⁻ \longrightarrow cytochrome b (Fe ²⁺)	0.075
Ubiquinone $+ 2H^+ + 2e^- \longrightarrow \text{ubiquinone H}_2$	0.10
Cytochrome c (Fe ³⁺) + e ⁻ \longrightarrow cytochrome c (Fe ²⁺)	0.254
Cytochrome $a (Fe^{3+}) + e^{-} \longrightarrow \text{cytochrome } a (Fe^{2+})$	0.29
Cytochrome a_3 (Fe ³⁺) + e ⁻ \longrightarrow cytochrome a_3 (Fe ²⁺)	0.35
$NO_3^- + 2H^+ + 2e^- \longrightarrow NO_2^- + H_2O$	0.421
$NO_2^- + 8H^+ + 6e^- \longrightarrow NH_4^+ + 2H_2O$	0.44
$Fe^{3+} + e^{-} \longrightarrow Fe^{2+}$	0.771 ^c
$O_2 + 4H^+ + 4e^- \longrightarrow 2H_2O$	0.815

 $^{^{}a}E'_{0}$ is the standard reduction potential at pH 7.0.

Aggirig

^bThe value for FAD/FADH₂ applies to the free cofactor because it can vary considerably when bound to an apoenzyme.

^cThe value for free Fe, not Fe complexed with proteins (e.g., cytochromes).

Industry Extraction of metals Dry & wet batteries

Fe Na Al

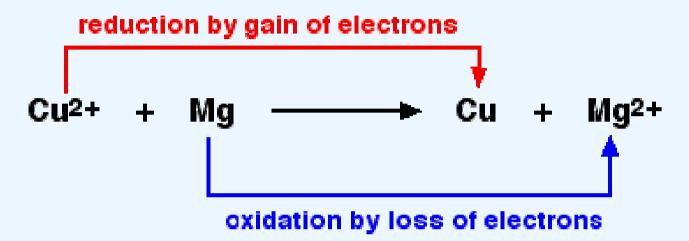

$$Fe_2O_3(s) + 3CO(g) \rightarrow 2Fe(s) + 3CO_2(g)$$

hematite

Redox reactions - transfer of electrons between species.

All the redox reactions have two parts (half reactions):

Oxidation (ON increases) Reduction (ON decreases) $\begin{array}{c} Mg \text{ -}2e \longrightarrow Mg^{2+} \\ Cu^{2+} + 2e \longrightarrow Cu \end{array}$

Mg: reducing agent: reduces others but get oxidized itself Cu²⁺: oxidizing agent: oxidizes others but get reduced itself

ON= oxidation no

Balancing Redox Equations

$$Fe^{2+} + MnO_4^- + H^+ \longrightarrow Mn^{2+} + Fe^{3+} + H_2O$$

- 1. Determine the elements that get oxidized and reduced.
- 2. Split the equation into half-reactions.
- 3. Balance all atoms in each half-reaction, except H and O.
- 4. Balance O atoms using H₂O.
- 5. Balance H atoms using H⁺.
- 7. Balance charge using electrons.
- 8. Sum together the two half-reactions, so that: e⁻ lost = e⁻ gained
- 9. If the solution is basic, add a number of OH^- ions to each side of the equation equal to the number of H^+ ions shown in the overall equation. Note that: $H^+ + OH^- \rightarrow H_2O$

Example

Do it by yourself

$$Fe^{2+} + MnO_4^- + H^+ \longrightarrow Mn^{2+} + Fe^{3+} + H_2O$$

$$MnO_4$$
 — Mn^{2+} Reduction half reaction $(+7)$

$$Fe^{2+} \longrightarrow Fe^{3+}$$

Oxidation half reaction

$$MnO_4^- + 8H^+ + 5e \longrightarrow Mn^{2+} + 4H_2O$$

$$5Fe^{2+} \longrightarrow 5Fe^{3+} + 5e$$

$$5Fe^{2+} + MnO_4^- + 8H^+ \longrightarrow Mn^{2+} + 5Fe^{3+} + 4H_2O$$

Standard oxidation/ reduction/ redox potential

- •The emf which determines the tendency or power of any atom towards e loss or gain under standard conditions is called std oxd or std red potential.
- Std condition: Ions in unit activity, Metal are solid, Gas at 1 atm/25 °C
- •Algebraic sum of the std oxd & std red potentials are called std redox potential

Std H Electrodes: The electrodes whose potential is arbitrarily assumed and with respect to which the potential of all other electrodes are determined: $2 \text{ H}^+(\text{aq}) + 2 \text{ e-} = \text{H}_2(\text{g})$ $E^0_{\text{H}}^+/_{1/2\text{H}2} = 0.0 \text{ V}$

International convention: std reduction potential

$$Fe^{3+} + e \longrightarrow Fe^{2+}$$

$$E^{0}_{Fe^{3+}/Fe^{2+}} = 0.77 \text{ V OR}$$

 $E^{0}_{Fe^{3+}/Fe^{2+}} = 0.77 \text{ V}$

TABLE 18.1	Standard Reduction Potentials at 25°C		
	Reduction Half-Reaction	E° (V)	
Stronger	$F_2(g) + 2e^- \longrightarrow 2F(a\underline{a})$	2.87	Weaker
oxidizing	$H_2O_2(aq) + 2 H^+(aq) + 2 e^- \longrightarrow 2 H_2O(l)$	1.78	reducing
agent	$MnO_4^-(aq) + 8 H^+(aq) + 5 e^- \longrightarrow Mn^{2+}(aq) + 4 H_2$	O(l) 1.51	agent
	$Cl_2(g) + 2e^- \longrightarrow 2Cl^-(aq)$	1.36	
	$Cr_2O_7^{2-}(aq) + 14 H^+(aq) + 6 e^- \longrightarrow 2 Cr^{3+}(aq) + 7 H_2$	$_{2}O(l)$ 1.33	
	$O_2(g) + 4 H^+(aq) + 4 e^- \longrightarrow 2 H_2O(l)$	1.23	
	$Br_2(l) + 2e^- \longrightarrow 2Br^-(aq)$	1.09	
	$Ag^+(aq) + e^- \longrightarrow Ag(s)$	0.80	
	$Fe^{3+}(aq) + e^{-} \longrightarrow Fe^{2+}(aq)$	0.77	
	$O_2(g) + 2 H^+(aq) + 2 e^- \longrightarrow H_2O_2(aq)$	0.70	
	$I_2(s) + 2e^- \longrightarrow 2I^-(aq)$	0.54	
	$O_2(g) + 2 H_2O(l) + 4 e^- \longrightarrow 4 OH^-(aq)$	0.40	
	$Cu^{2+}(aq) + 2e^{-} \longrightarrow Cu(s)$	0.34	
	$\operatorname{Sn^{4+}}(aq) + 2 e^{-} \longrightarrow \operatorname{Sn^{2+}}(aq)$	0.15	
	$2 H^+(aq) + 2 e^- \longrightarrow H_2(g)$	0	
	$Pb^{2+}(aq) + 2e^{-} \longrightarrow Pb(s)$	-0.13	
	$Ni^{2+}(aq) + 2e^{-} \longrightarrow Ni(s)$	-0.26	
	$Cd^{2+}(aq) + 2e^{-} \longrightarrow Cd(s)$	-0.40	
	$Fe^{2+}(aq) + 2e^{-} \longrightarrow Fe(s)$	-0.45	
	$Zn^{2+}(aq) + 2e^{-} \longrightarrow Zn(s)$	-0.76	
	$2 H_2O(l) + 2 e^- \longrightarrow H_2(g) + 2 OH^-(a)$	q) -0.83	
	$Al^{3+}(aq) + 3e^{-} \longrightarrow Al(s)$	-1.66	
Weaker	$Mg^{2+}(aq) + 2e^{-} \longrightarrow Mg(s)$	-2.37	Stronger
oxidizing	$Na^+(aq) + e^- \longrightarrow Na(s)$	-2.71	reducing
agent	$Li^+(aq) + e^- \longrightarrow Li(s)$	-3.04	agent

Application of std reduction potential value

$$\Delta G^0 = - n F E^0$$

Spontaneous reaction: $\Delta G^0 < 0$, then E^0 must be >0

A reaction is favorable if $E^0 > 0$

(a)
$$2H^+$$
 (aq) + $2e \longrightarrow H_2(g)$

$$E^0 (H^+, H_2) = 0.0 V$$

(b)
$$Zn^{2+}(aq) + 2e \longrightarrow Zn(s)$$

$$E^0$$
 (Zn²⁺, Zn) = -0.76 V

$$(a-b)2H^{+}(aq) + Zn(s) \longrightarrow Zn^{2+}(aq) + H_{2}(g)$$
 $E_{cell}^{0} = +0.76 \text{ V}$

$$E_{cell}^0 = +0.76 \text{ V}$$

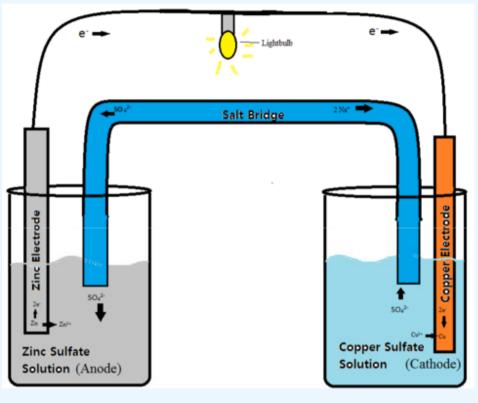

Reaction is favorable

High std reduction potential: Highly oxidizing agent

Note: this is full redox reaction: e are cancelled out

Galvanic Cell: a electrochemical cell

Electricity: by cost of redox reactions

Test Question: Predict if Ag will be oxidized when immerged In $CuSO_4$ solution. E^0 (Cu^{2+} , Cu) = 0.34 V E^0 (Ag^+ , Ag) = 0.80 V

$$Zn^{2+}(aq) + 2e \longrightarrow Zn(s)$$

$$Cu^{2+}(aq) + 2e \longrightarrow Cu(s)$$

$$E^0$$
 (Zn²⁺, Zn) = -0.76 V

$$E^0$$
 (Cu²⁺, Cu) = 0.34V

$$Cu^{2+} + Zn \longrightarrow Zn^{2+} + Cu$$

$$E_{cell}^0 = 0.34 - (-0.76) = 1.10V$$

(high + ve value, spontaneous)

Diagrammatic presentation of potential data

Latimer Diagram (reduction potential diagram)

Frost Diagram (oxidation state diagram)

Latimer Diagram

*The numerical value of std red pot (in v) is written over a horizontal line (or arrow) connecting species with the element in different OS

* Written with the most oxidized species on the left, and the most reduced species on the right.

* Oxidation number decrease from left to right and the E^0 values are written above the line joining the species involved in the couple.

$$A^{+5} \xrightarrow{W} B^{+3} \xrightarrow{X} C^{+1} \xrightarrow{y} D^0 \xrightarrow{Z} E^{-2}$$

What could be extracted from Latimer Diagram...

$$Fe^{2+} + 2e \longrightarrow Fe \qquad E^{\circ} = -0.440 \qquad -2 \times F \times -0.44 = 0.88F$$

$$Fe^{3+} + e \longrightarrow Fe^{2+} \qquad E^{\circ} = 0.77 \qquad -1 \times F \times +0.77 = -0.77F$$

$$Fe^{3+} + 3e \longrightarrow Fe \qquad -3 \times F \times E^{\circ} \text{ Fe}^{3+/\text{Fe}} = +0.11 \text{ F}$$

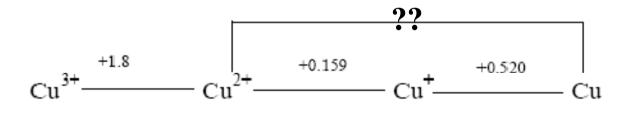

$$\Rightarrow E^{\circ} \text{ Fe}^{3+/\text{Fe}} = -0.036$$

$$-0.036$$

Note: this is HALF reaction: e are NOT cancelled out

What could be extracted from **Latimer Diagram...**

Reaction	Potential	$\Delta G = nFE$
$Cu^+ + e^- \rightarrow Cu$	+0.520 V	$-1 \times F \times 0.520$
$Cu^{2+} + e^{-} \rightarrow Cu^{+}$	+0.159 V	$-1 \times F \times 0.159$
$Cu^{2+} + 2e^{-} \rightarrow Cu$	NOT 0.679!	$-2 \times F \times E^0 = -0.679F$

$$E^0 Cu^{2+}/Cu = 0.34 V$$

Latimer diagram for chlorine in acidic solution

$$ClO_{4} \xrightarrow{+1.2} ClO_{3} \xrightarrow{+1.18} HClO_{2} \xrightarrow{+1.65} HClO \xrightarrow{+1.63} Cl_{2} \xrightarrow{+1.36} Cl_{1} \xrightarrow{+1.7} ClO_{1} \xrightarrow{+1.65} HClO_{2} \xrightarrow{+1.65} HClO_{2} \xrightarrow{+1.65} HClO_{2} \xrightarrow{+1.65} Cl_{2} Cl_{2} \xrightarrow{+1.65} Cl_{2} Cl_{2} \xrightarrow{+1.65} Cl_{2} Cl_{2}$$

$$HClO(aq) + H^{+}(aq) + e \longrightarrow \frac{1}{2}Cl_{2}(g) + H_{2}O(1)$$
 $E^{o} = +1.63 \text{ V}$

$$\frac{1}{2} \text{Cl}_2(g) + e \longrightarrow \text{Cl}^-(1)$$
 Eo = +1.36 V

Simple formula

$$\Delta G = \Delta G' + \Delta G''$$

$$-nFE = -n'FE' - n''FE''$$

$$E = n'E' + n''E''$$

$$n'+n''$$

Write the balanced equation for the

$$HClO(aq) + H^{+}(aq) + 2e \longrightarrow Cl^{-}(1) + H_{2}O(1)$$
 $E^{o} = 1.5 \text{ V}$

Latimer diagram for chlorine in basic solution

$$ClO_{4} \xrightarrow{+0.37} ClO_{3} \xrightarrow{+0.3} ClO_{2} \xrightarrow{+0.68} ClO \xrightarrow{+0.42} Cl_{2} \xrightarrow{+1.36} Cl$$

Balance the half reactions...

$$2ClO^{-}(aq) + 2H_{2}O(l) + 2e^{-} \longrightarrow Cl_{2}(g) + 4OH^{-}(aq)$$
 $E^{0} = 0.42 \text{ V}$ $Cl_{2} + 2e \longrightarrow 2Cl^{-}$ $E^{0} = 1.36 \text{ V}$

Why not ½ Cl₂ like before? Try it out: same result

 $E^{o} = +0.89$

Disproportionation

Element is simultaneously oxidized and reduced.

$$2 M^{+}(aq) \longrightarrow M(s) + M^{2+}(aq)$$

$$ClO_{4} \xrightarrow{+0.37} ClO_{3} \xrightarrow{+0.3} ClO_{2} \xrightarrow{+0.68} ClO \xrightarrow{+0.42} Cl_{2} \xrightarrow{+1.36} Cl$$

'the potential on the left of a species is less positive than that on the right- the species can oxidize and reduce itself, a process known as disproportionation'. Continued.....

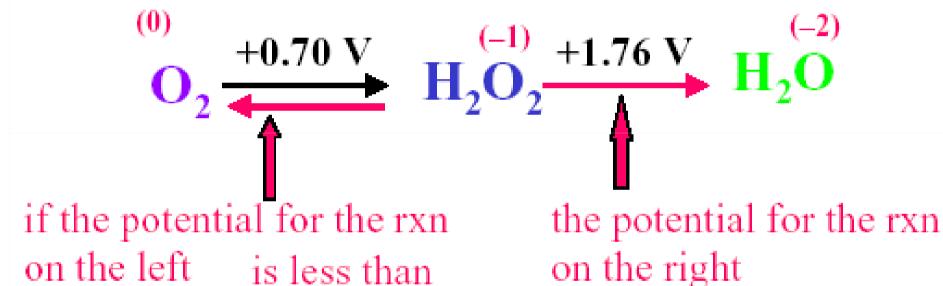

$$Cl_2(g) + 2 e^- \longrightarrow 2Cl^-(aq)$$
 $E^0 = +1.36 \text{ V}$
 $Cl_2(g) + 4OH^-(aq) \longrightarrow 2ClO^-(aq) + 2H_2O(l) + 2e^ E^0 = -0.42 \text{ V}$

$$Cl_2 + 2OH^- \longrightarrow ClO^- + Cl^- + H_2O$$
 $E^0 = 0.94 \text{ V}$

Full rkn Reaction is spontaneous as E⁰ is positive

Note: this is full redox reaction: e are cancelled out

Disproportionation

.....then, the species in the middle, H₂O₂, will **disproportionate**

Is it spontaneous?

$$H_2O_2(aq) + 2H^+(aq) + 2e^- \longrightarrow 2H_2O(aq)$$

$$E^0 = +1.76 \text{ V}$$

$$H_2O_2(aq)$$
 \longrightarrow

$$O_2(g) + 2H^+(aq) + 2e^- E^0 = -0.70 V$$

$$E^0 = -0.70 \text{ V}$$

$$^{-1}$$
 $^{-2}$ $^{-2$

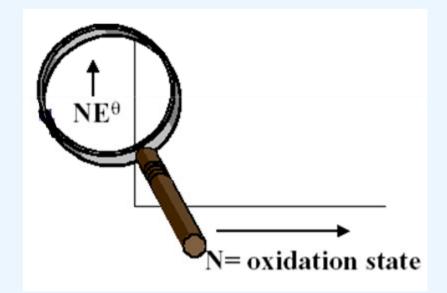

$$E^0 = +1.06 \text{ V}$$

Yes the reaction is spontaneous

Auto-decomposition of H₂O₂ in lab

Graphically illustration of the stability of different oxidation states relative to its elemental form (ie, relative to oxidation

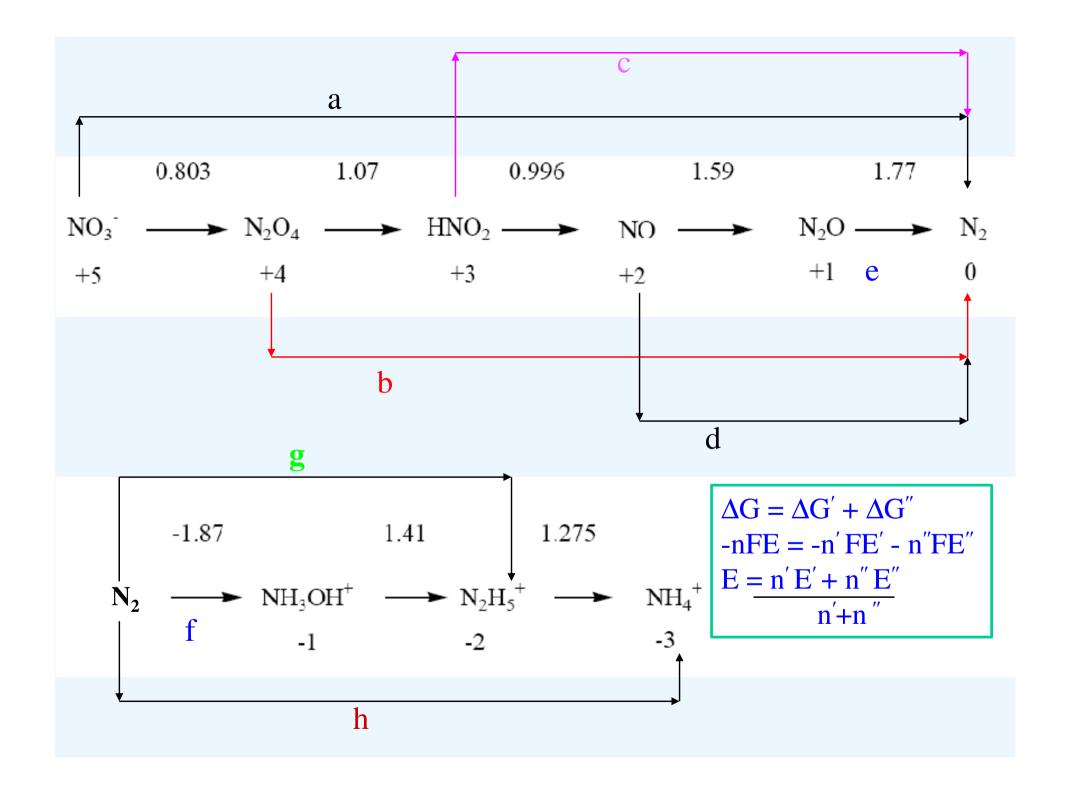

state= 0)

FD of an element X is a plot of NE^0 for the couple X^N/X^0 against the oxd no N, of the element.

Look at the Latimer diagram of nitrogen in acidic solution

From Latimer diagram, you can make the Frost Diagram

By using the equation in Latimer diagram we can calculate....

a
$$NO_3^- + 6H^+ + 5e^ 1/2 N_2 + 3H_2O$$
 $E^0 = 1.25V$

b
$$\frac{1}{2} N_2 O_4 + 4H^+ + 4e^ \frac{1}{2} N_2 + 2H_2 O$$
 $E^0 = 1.36V$

$$^{\circ}$$
 HNO₂ + 3H⁺ + 3e⁻ $^{-}$ $^{1/2}$ N₂ + 2H₂O $^{\circ}$ E⁰ = 1.45V

e
$$\frac{1}{2}$$
 N₂O + H⁺ + e⁻ $\frac{1}{2}$ N₂ + $\frac{1}{2}$ H₂O $\frac{1}{2}$ E⁰ = 1.77V

$$f V_2 N_2 + 2H^+ + H_2O + e^- \longrightarrow NH_3OH^+ E^0 = -1.87V$$

$$\frac{g}{N_2} + \frac{5}{2} H^+ + 2e^- \qquad \frac{1}{2} N_2 H_5^+ \qquad E^0 = -0.23 V$$

h
$$\frac{1}{2} N_2 + 4H^+ + 3e^ NH_4^+$$
 $E^0 = 0.27V$

Oxidation state: species

 $N \times E^0$, N $N(V): NO_3^ (5 \times 1.25, 5)$

 $N(IV): N_2O_4$ $(4 \times 1.36, 4)$

N(III): HNO₂ $(3 \times 1.35, 3)$

N(II): NO $(2 \times 1.68, 2)$

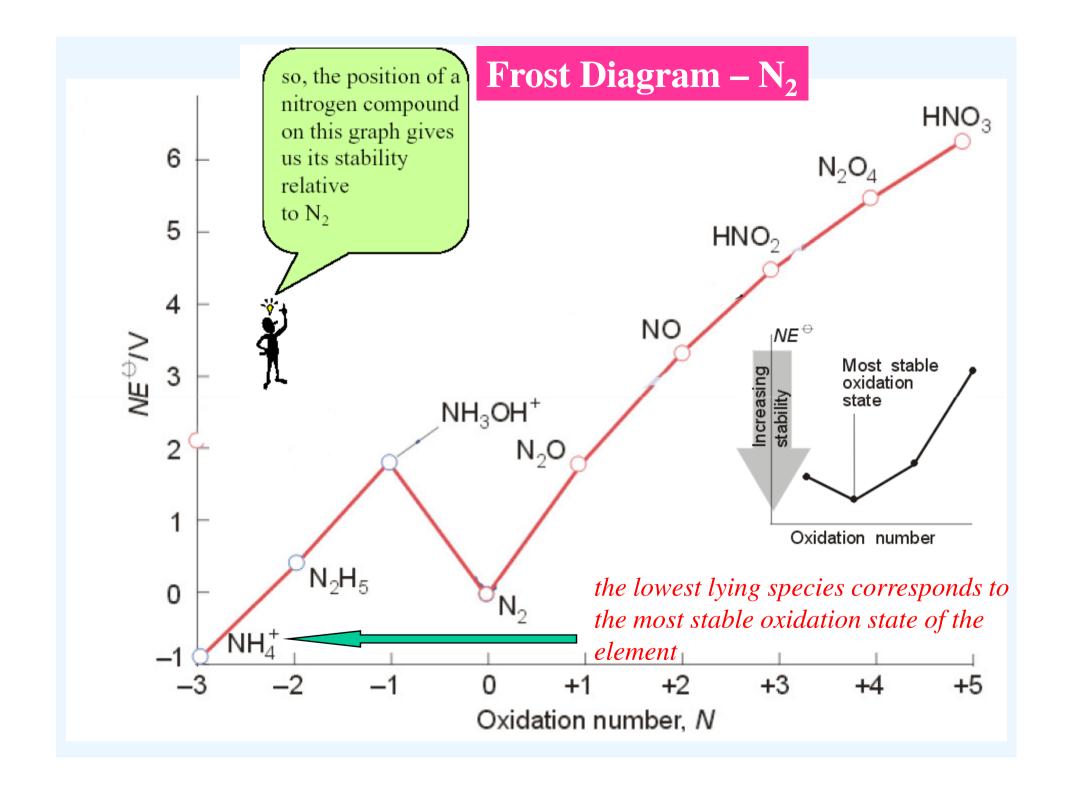

N(I): N_2O $(1 \times 1.77, 1)$

 $N(0): N_2$ (0, 0)

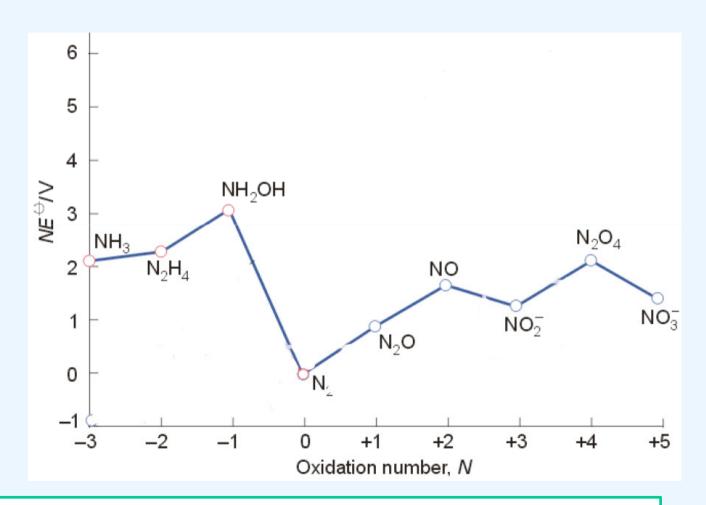

N(-I): NH_3OH^+ $[-1 \times (-1.87), -1]$

 $[-2 \times (-0.23), -2]$ $N(-II): N_2H_5^+$

N(-III): NH_{Δ}^+ $(-3 \times 0.27, -3)$

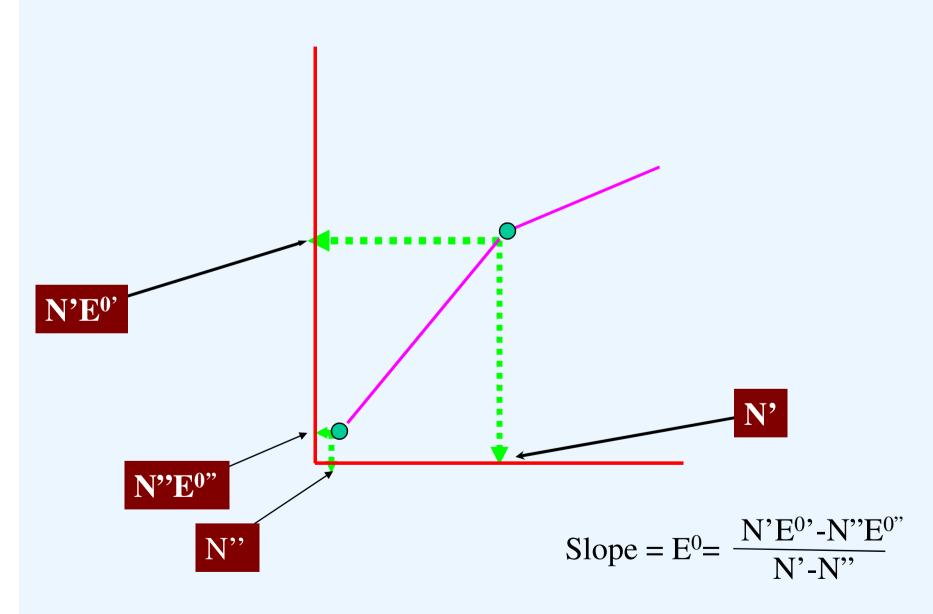

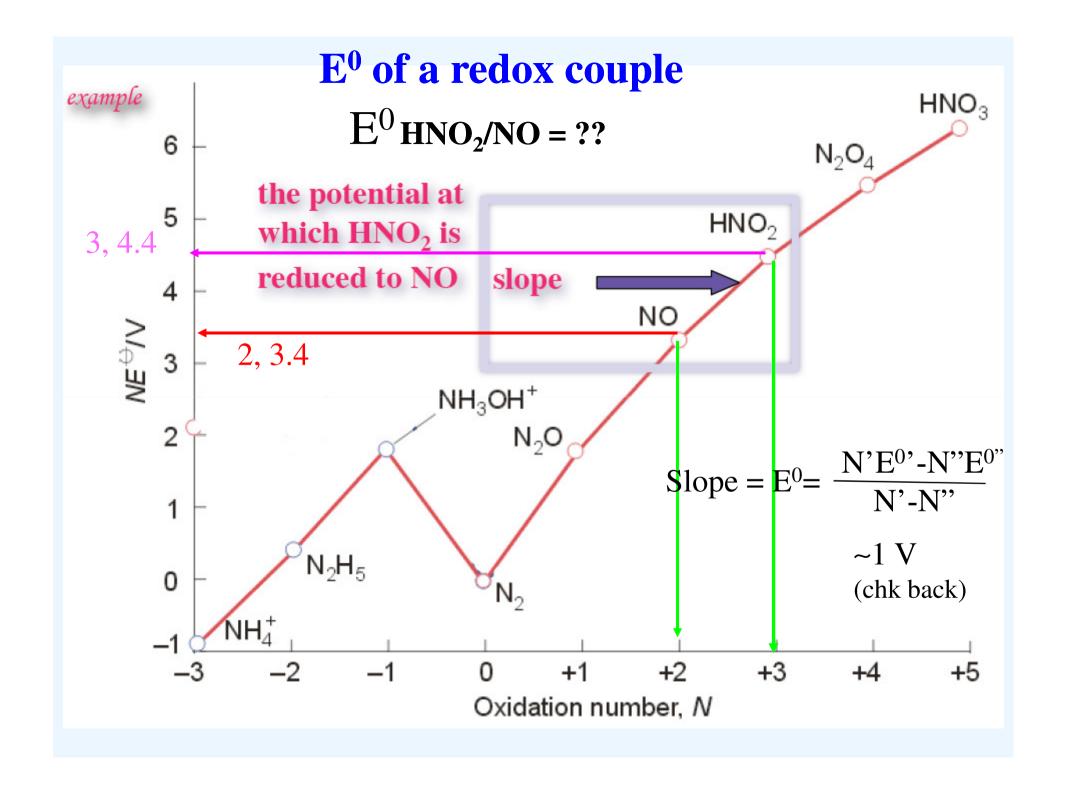

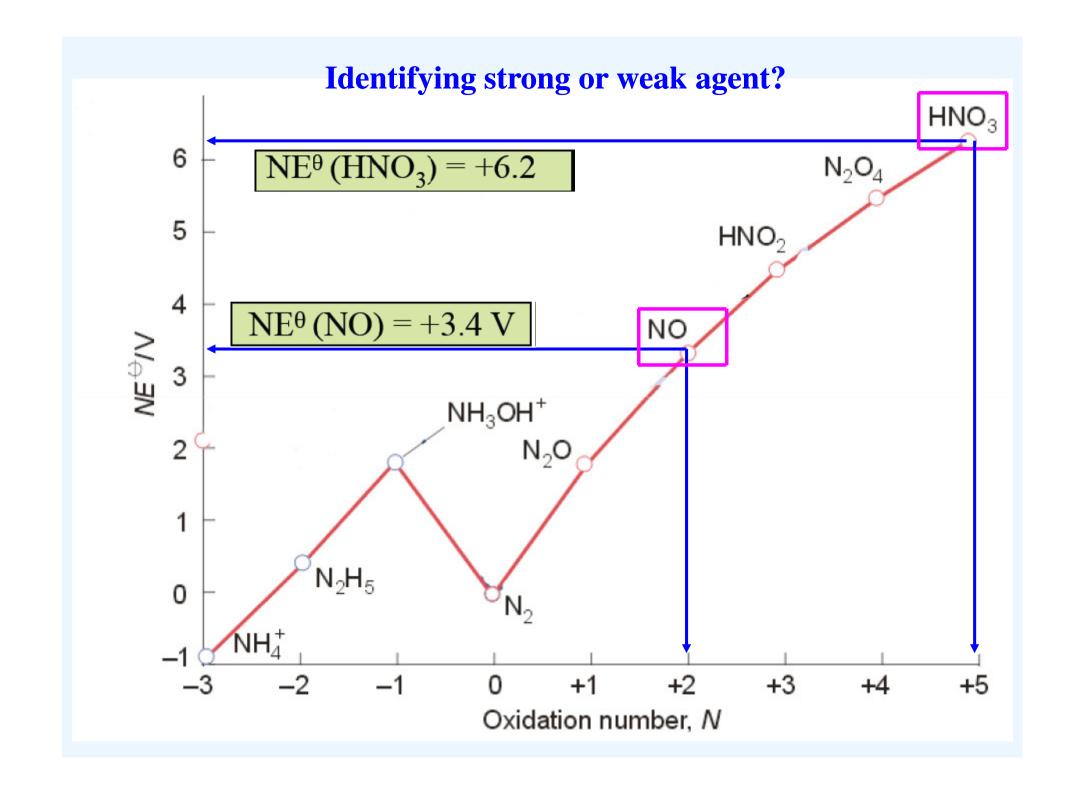

Conclusion: Higher oxides & oxo-acids are unstable in acidic sol but relatively stable in basic sol

Slope of the line joining any two points is equal to the std potential of the couple.

From the coordinates of HNO_3 ((+5, +6.2) and NO (+2, +3.4) on the nitrogen Frost diagram we can determine the reduction potential for the half reactions below

2 HNO₃ + 10e⁻ + 10H⁺
$$\longrightarrow$$
 N₂ + 6H₂O

$$NE^{\theta} = +6.2 \text{ V} \quad \text{from graph y-value}$$

$$N = +5 \quad \text{from graph x-value}$$

$$E^{\theta} = +1.24 \text{ V}$$

$$2 \text{ NO} + 4e^- + 4H^+ \longrightarrow N_2 + 2H_2O$$

$$NE^{\theta} = +3.4 \text{ V}$$

$$N = +2$$

$$N = +2$$

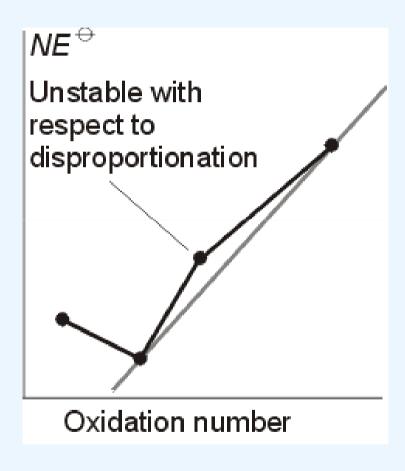

But, keep in mind that this potential only

 $E^{\theta}\!=\!+1.70~V$

corresponds to the potential at which a given species converts to its elemental forn

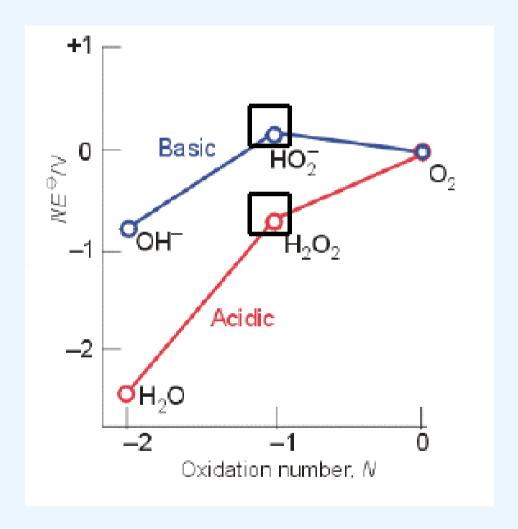

Disproportionation

What Frost diagram tells about this reaction?

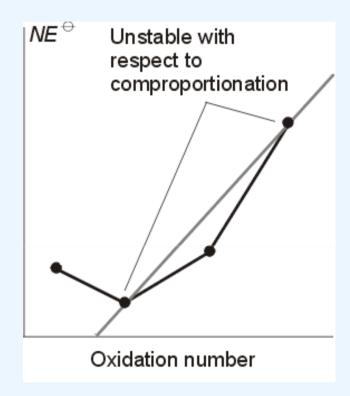

Disproportionation.... another example

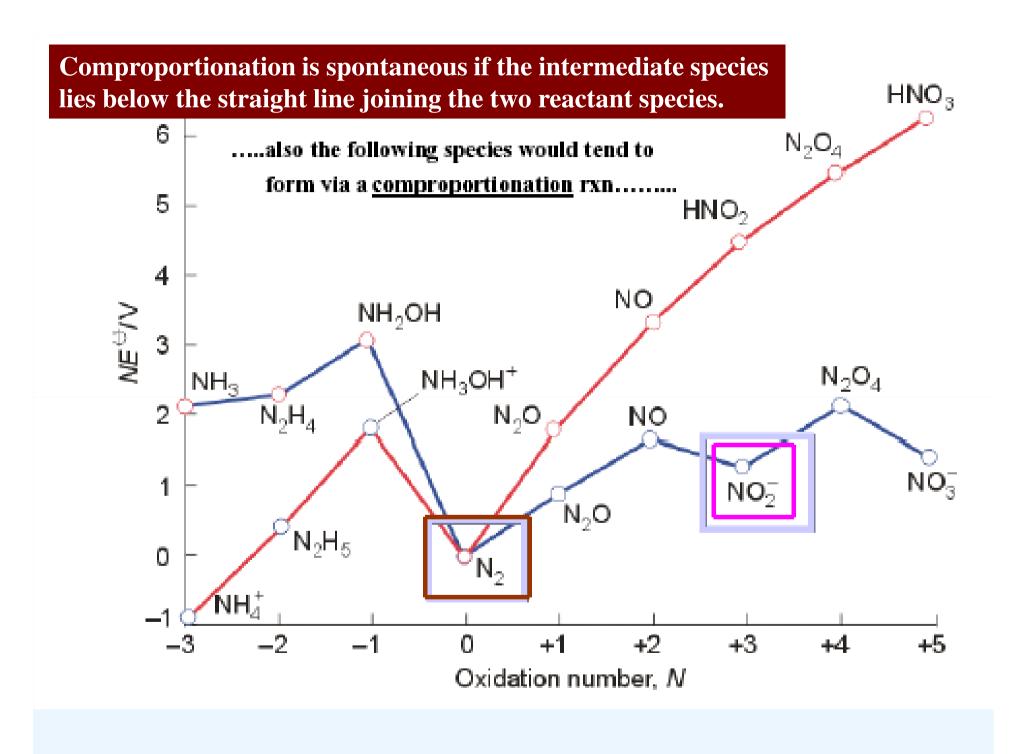

this is peroxide auto decomposition

Comproportionation reaction

In comproportionation, the reverse of disproportionation, two species with the same element in different OS form a product in which the element is in intermediate OS

Comproportionation Reactions:

$$^{+2}$$
 NO + $^{+4}$ NO₂ $^{-}$

A higher oxidation state species combines with a lower oxidation state species to afford an intermediate oxidation state species

Not balanced

Half reactions:

$$N_2O_4 + 2K^- \longrightarrow 2 NO_2^-$$
 (reduction rxn)
$$2 NO_2 + 4OH^- \longrightarrow 2(NO_2^- + K^-) + 2 H_2O$$
 (oxidation rxn)

Net row 2NO +
$$N_2O_4$$
 + 4OH⁻ \longrightarrow 4 NO₂⁻ + 2 H₂O

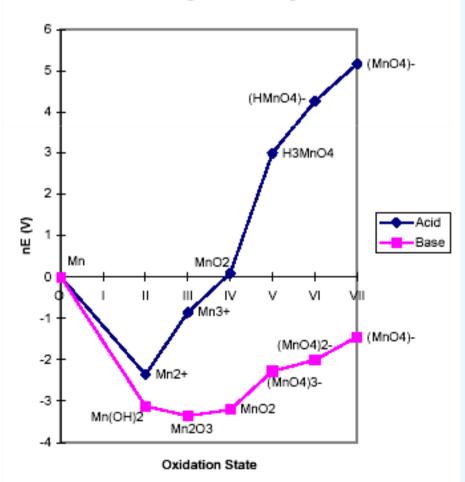

balanced

Construction of Frost diagram of Mn from the following Latimer diagram

basic solution $MnO_{4}^{-} - \frac{0.56}{MnO_{4}^{2}} - \frac{0.27}{MnO_{4}^{3}} - \frac{0.93}{MnO_{2}} - \frac{0.146}{MnO_{2}^{3}} - \frac{0.234}{MnO_{3}^{2}} - \frac{-0.234}{MnO_{4}^{3}} - \frac{-0.234}{MnO_{4}^{3}} - \frac{0.93}{MnO_{4}^{3}} - \frac{0.93}{MnO_$

Comproportionation: In acidic solution... $Mn + Mn^{3+} \longrightarrow Mn^{2+}$ In basic solution... $MnO_2 + Mn(OH)_2 \longrightarrow Mn_2O_3$

Frost Diagram for Manganese

From diagram comment on Stability of Mn³⁺ in acidic sol

disproportionation

Mn³⁺ lies above the line joining MnO₂ & Mn²⁺

From the Frost diagram for Mn....

- * Thermodynamic stability is found at the bottom of the diagram.

 Mn (II) is the most stable species.
- * A species located on a convex curve can undergo disproportionation example: MnO_4^{3-} \longrightarrow MnO_2 and MnO_4^{2-} (in basic solution)

$$2 \text{ MnO}_4^{3-} + 2 \text{ H}_2\text{O} \rightarrow \text{MnO}_4^{3-} + \text{MnO}_2 + 4 \text{ OH}^{-}$$

- •Any species located on the upper right side of the diagram will be a strong oxidizing agent. MnO_4 oxidizing agent.
- •Any species located on the upper left side of the diagram will be a reducing agent. Mn reducing agent.
